Project Office Overview

(J. Cooper)

Due to the FY08 Omnibus Appropriations Bill of December 2007, the NOvA resource loaded schedule was reworked for a February 2009 restart. This schedule now serves as the NOvA Project baseline approved for CD-2 in September 2008. When funding for NOvA was restored in July 2008 by the FY08 Supplemental Appropriations Bill, the project began working on tasks in advance of this baseline schedule and reached a positive schedule variance of 1.4 M\$ in January 2009 on 17.6 M\$ of scheduled work. This can also be expressed as a Schedule Performance Index (SPI) of 1.08.

This is the February 2009 Monthly report, and so real time has now caught up with the slipped baselined schedule. As you will see in this report, the project SPI dropped to 0.99 in February with a negative schedule variance of 0.2 M\$ on 20.1 M\$ of scheduled work. This indicates that the project is now just on schedule.

Future performance now depends on the results of the FY09 Appropriation and on possible funding via the America Recovery and Reinvestment Act (Stimulus Bill). These congressional actions were still in progress during February.

In addition to funding, future NOvA performance also depends on full staffing of the project. In this aspect, almost all the required NOvA staff was available in February with the two previously recognized problem areas beginning to see additional effort:

- NOvA data acquisition software effort continued to be a problem since
 Fermilab people had been reassigned to other higher priority projects.
 Meetings among the new NOvA data acquisition software manager with the
 re-assigned workers and a few new team members began to take place
 regularly in February.
- NOvA Project Controls effort had been a problem since Fermilab NOvA people were participating heavily in preparations for the FRA Earned Value Management System (EVMS) Certification process. This FRA effort declined during February and the team turned its attention back to NOvA.

During February the Ash River Site Preparation and Far Detector Building drawing package work advanced to a complete bid package. The University of Minnesota will handle this effort as part of a DOE Cooperative Agreement and anticipates the following schedule:

- March 3 Request for Proposals distribution
- March 9 Advertisement in the Minnesota State Register
- March 17 Mandatory Pre-Proposal Meeting in Minneapolis
- April 6 Deadline for Questions
- April 15 Proposals Due
- April 20 Proposal Review Complete, Short list of bidders developed
- April 24 Interview Short Listed firms
- April 28 Award of Contract

The extent of the Site and Building contract award will depend on the amount of funding from DOE that is in hand at the University of Minnesota on April 28. Currently only

\$3M is in hand from the Cooperative Agreement FY09 Continuing Resolution allocation. The Site Preparation Package (phase one: access road and excavation, but no building construction) will require about \$10M minimum, so additional funding will be needed to award phase one as scheduled. The Site and Building work is on the NOvA critical path.

The DOE OECM EVMS Certification Review of FRA has now been scheduled for the week of May 11.

The DOE Office of Science Internal Project Review for NOvA CD-3b has been proposed for July 21-23. This date was still under consideration by all parties at the end of February.

Glossary of Terms

A number of NOvA acronyms and other acronyms are often used in these monthly reports. In an effort to add clarity and reduce editing time, these acronyms are defined here in each report and are not always spelled out in the body of the text.

ACWP Actual Cost of Work Performed AD Fermilab Accelerator Division

ADC Main Ring Dipole, type A laminations, generation "C"

Narrative Summaries of Technical Progress

WBS 1.0 & 2.0 Accelerator & NuMI Upgrades

(P. Derwent)

1.0.1.1 Recycler Ring Modifications

The contract mechanical engineer hired in January compiled existing data for Injection Line planning with assistance of in house mechanical engineer, drafter, and physicist.

ADC magnet prototyping:

An Accelerator Division power supply was identified that is suitable for testing the ADCW magnets. Spacer/Coil design was finished. Drawings for other NON-spacer ancillary parts (manifolds & such) are still underway.

RQN magnet:

Simple trimming (i.e. washer adjustments) can only adjust the magnet by ~5%. Most magnets will need to be reduced by a greater amount. This will require swapping some magnetic bricks for smaller bricks. For that level of "trimming" the magnetizer/measurement system needs to be up and running so new (smaller) bricks can be prepared.

PDS magnets:

The vendor had to disassemble and reassemble the magnet with a corrected brick configuration. Disassembly has occurred but current tooling turned out to be insufficient for re-assembly due to the magnet strength. Tooling is being redesigned.

1.0.1.2 Recycler Kicker Systems

Work has mainly been concentrating on the off-project gap clearing kickers. Work on the NOVA/ANU project scope will ramp up later this year.

Winding began on four PFL's, but the rest of the cable has been delayed until mid-April. The manufacturer has to re-make the cable again.

Discussions continued on the design of the abort magnet. The case assembly has been drawn - further design requires electrical modeling.

Modeling of the RR Extraction / MI Injection magnet continued. Saturation effects and inductance were investigated. A decision was made to use CMD5005 ferrite with a permeability of 1200. Because this material has a lower permeability at higher frequency, the pulser will have to be slowed down. Drafting on the magnet is now waiting for the modeling.

1.0.1.3 Recycler Instrumentation

BPM--Work continued on finalizing the design of the BPM cables and transition boards. As the cable price quote is 1.5 years old, we recently requested another quote from a vendor and noted that the price is just a few percent higher than that quoted 1.5 years ago.

DCCT—We are evaluating the costs of purchasing off-the-shelf unit vs. design and fabrication in-house as noted in the design report.

1.0.1.4 Recycler Radiation Safety

Measurements were made in February in the regions near MI39 and MI14 as part of planning for penetration and gap clearing kicker installation in 2009. Progress continues on the updated MI shielding assessment.

1.0.2.1 MI Modifications

LLRF design works continues (has reached 40%). We received the VXI crates and controllers and we started developing the hardware and software for the system.

1.0.2.2 MI RF Cavities

Half of the six Higher Mode Dampers have been assembled and the rest will be completed as the machine shop parts come in.

The first Main Injector cavity is in the Test Station and is being evaluated. The second Main Injector cavity passed its water test and is now having its vacuum checked.

1.0.2.3 MI Radiation Safety

See 1.0.1.4

1.0.3.1 NuMI Primary Proton Beam

Procurements began for the Bµlb regulation systems for the six major dipole power supplies for the primary proton beam. These are CD-3a items.

1.0.3.2 NuMI Target Hall Technical Components

Work began on the task "assessment of baffle for higher beam-heating loads". To load-level the time of people, the start of the task "Analyze Current Hadron Monitor Design for Higher Beam Power" was delayed to follow the baffle task.

1.0.3.3 NuMI Target Hall Infrastructure

NuMI Target Hall Space Planning & Horn 2 Relocation to Medium Energy: Work on the Horn 2 stripline extension assembly sketch continued. Thermal expansion and new location to anchor the stripline was worked out. Details of support of the stripline were sketched. Work continued on the task, "Design New Equipment for Operations".

Target Chase:

Work on the FE Analysis of Horn 1 stripline was re-started. A comprehensive multi-conductor model was developed and preliminary thermal results were obtained.

1.0.3.4 Decay Pipe, Hadron Absorber and Utilities

Work has begun to acquire necessary design input for the cooling water systems.

1.0.4 Beam Physics

Final ECloud detector fabrication was begun. A location in MI-52 was tentatively identified for a future installation (2010 or later). Beam Dynamics and ECloud

simulations continued with ORBIT. Optimization of the slip stacking procedure continued. Main Injector loss patterns with collimators were studied for NOvA era predictions; more measurements will be necessary to disentangle some of the loss mitigation techniques in use by the Main Injector.

WBS 2.0 ANU Construction

(P. Derwent)

2.0.2.1.1 Upgrade Vertical Quad Bus with New Transformer

A transformer was bought last year with accelerator division funds and we transferred the requisition to the NOVA project. The transformer waits approval by the AD EE support department. Expected delivery is 2 months.

2.0.3.3 NuMI Target Hall Infrastructure

Horn 2 Re-location to Medium Energy—Shielding Reconfiguration:
Work continued on the task: "Final Design-Shielding Blocks & Remote Lifting
Components". Structural Grade bolts were added to the T-Block design (to support the hanging steel), as a redundant system for added safety.

2.0.4 ANU Project Management

ANU management worked to identify potential applications of ARRA funds and investigated ways to streamline the status reporting system.

WBS 1.1 & 2.1 Site and Building

(S. Dixon)

1.1.1 Site conditions Investigation

- 1.1.1.1 Topographic Survey
- 1.1.1.2 Subsurface Investigation
- 1.1.1.3 Wetland Delineation
- 1.1.1.4 Revise Ash River Environmental Assessment Worksheet

These tasks are complete.

1.1.2. Title 1 Preparation

- 1.1.2.1 Site Preparation Advanced Technical Design
- 1.1.2.2 Building Design Modifications
- 1.1.4.1 Independent Cost Estimate Review
- 1.1.4.2 Secondary Containment Study
- 1.1.4.3 Overburden Study
- 1.1.4.5 Risk Management Assessment

These tasks are complete.

1.1.4.7 Advanced Technical Design – Far Detector Building

In February 2009, the construction documents were revised to incorporate the comments received during the Project Coordination Review in January 2009

2.1.1 Site Preparation Package

2.1.1.1 Site Preparation Package - Title 2 (Design) Phase

In February 2009, the construction documents were revised to incorporate the comments received during the Project Coordination Review in January 2009.

2.1.1.2 Site Preparation Package - Wetland Mitigation

Documentation for the purchase of the Wetland Credits was received in February 2009.

2.1.1.3 Site Preparation Package – Procurement Phase

Additional discussions with University of Minnesota and Hines personnel continued in February 2009. The goal remains to develop a procurement strategy similar to that described in the December 2009 report.

2.1.2 Far Detector Building

2.1.2.1 Far Detector Building - Title 2 (Design) Phase

The project team tasked an outside architectural/engineering firm to review the Far Detector Building documents and provide a general overview of the status of the documents and the suitability for the intended purpose. The comments from Crawford Murphy & Tilly were received in February 2009.

In February 2009, the construction documents were revised to incorporate the comments received during the Project Coordination Review in January 2009.

2.1.2.2 Far Detector Building – Procurement Phase

See description in 2.1.1.3 above.

2.1.2.3 Far Detector Building – Build Phase

No Activity this month.

2.1.3 Site and Building Security

The activities associated with this WBS item have been incorporated into the design of the Far Detector Building (WBS 2.1.2.1).

WBS 1.2 Liquid Scintillator

(S. Mufson)

1.2.1, 1.2.9 Requirements and Procurement

No change from last month.

1.2.4, 1.2.7 Production Methods

At Indiana several samples of scintillator with varying concentrations of fluors were prepared to study new tests of concentration. These samples were analyzed by Jon Karty of Indiana University Chemistry and the samples are being used in our exploration of the gamma test described below.

Three of the scintillators, 94% of baseline fluors, 100% of baseline fluors, 102% of baseline fluors had chemical analysis of the samples. The mass fractions measured for pseudocumene, PPO, and bis-MSB order the three samples by concentration correctly but do not give quanitative results better than about 5-10%.

1.2.2, 1.2.3, 1.2.8 R&D Studies

Indiana found a problem (see December 2008 monthly report) in the original alpha test, requiring investigation of alternative tests of composition. Tests continued during February on a system that uses a gamma source instead of an alpha source.

1.2.5 QA/QC

The IU gamma test setup consists of a gamma source that irradiates a scintillator sample and an alpha source encased in plastic scintillator that provides a calibration signal. The test parameter is the ratio of the channel that registers the scintillator's Compton edge to the channel that registers the calibration peak. The measurements are made with an MCA. The ratio should increase as the fluor concentration of scintillator increases. The low concentration of fluors should not saturate the scintillator light.

Preliminary analysis in February was inconclusive. Systematic errors may mask the effect, so work began addressing these systematic errors by improving the scintillator composition QA gamma test. These improvements include: adding the plastic scintillator + alpha source to monitor the electronics drift; adding new holder that attaches to the PMT and guarantees repeated positioning of the scintillator sample bottle.

The work at SMU was directed at resolving the discrepancies between measurements of attenuation length at SMU & IU for a common mineral oil sample. Test measurements are being performed that probe the beam profile in the SMU spectrometer as a function of oil column length. The measurements are in progress.

1.2.6 Shipping

- 1.2.7 Blending Investigations
- 1.2.8 Component Acquisition Investigations
- 1.2.9 Integration Prototype Detector Scintillator Production
- 1.2.10 Production Scintillator Specifications
- 1.2.11 Management R&D Phase

No change from last month.

WBS 1.3 Wavelength Shifting Fiber

(C.Bromberg)

1.3.1 Requirements

1.3.2. Vendor Investigations

1.3.3 Wavelength Shifting Fiber Optimization Studies

No change this month.

1.3.4 Development of QA/QC Methods

At MSU, a number of tests with previously delivered fiber were completed. Multiple wraps (up to 10) were performed on the same section of fiber of preproduction fiber. The attenuation lengths are not affected at normal tension or when increased by 50%. Calibration of the fiber illumination at each hole was completed. Absolute calibration is better than 0.5%. Preliminary design of the transportable fiber scanner began.

1.3.5 Integration Prototype- Near Detector Production

100 kilometers of IPND fiber was delivered on February 9, and QA of the fiber was started. The first spool tested showed attenuation lengths as good as or better than most of the preproduction spools that were tested. Attenuation length at 580 nm was > 15 m.

1.3.6 Production WLS Fiber Specifications

1.3.7 Management – R&D Phase

No change during this month.

WBS 1.4 PVC Extrusions

(R. Talaga)

1.4.1 Physical Properties Determination and Test Method Development

N-27 PVC creep test stands at constant (room) temperature are in progress.

Tests to look for possible adverse effects of exposing N-27 PVC (under tension) to liquid scintillator have been ongoing for over a year. Samples of N-27 have now been removed and will be analyzed by examination with microscopes next month.

1.4.2 Raw Materials

1.4.3 Extrusions

No progress this month.

1.4.4 Shipping and Handling1.4.6 Management

A caster jack prototype, used to move stacks of extrusions onto trucks and about the assembly area, is being developed at the University of Minnesota. An updated design is undergoing an engineering stress analysis. Once the analysis is completed a new set of caster jacks will be produced.

1.4.6 Management

The Monthly Progress report, Schedule Turnaround report, and a EVMS variance report were submitted.

WBS 1.5 PVC Modules

(K. Heller/ D. Hennessy)

1.5.1 Requirements

No Change this month.

1.5.2 End Seal R&D

A sample manifold was received from PMC (Plastic Molded Concepts). Minor defects were noted (small number of burn marks present). The sample piece is within tolerances for the PVC extrusions. Injection port holes on the manifold need to be moved since currently they are located on a surface that will be sealed with glue.

1.5.3 Photo Detector Interface R&D

No Change this month.

1.5.4 Module Factory R&D

We began specifying a glue robot for the end seals.

A fourth generation of bubblers was designed with a smaller pressure head which should provide quicker response to leaks.

1.5.5 Quality Assurance and Quality Control Methods Development

We started new series of Compton scattering measurements on scintillator. This checks whether the fast (5-minute) epoxy that will be used to seal optical connector degrades the scintillator.

We began testing a new high-flow PVC resin to see whether the scintillator is degraded upon exposure to the resin.

1.5.6 Module shipping and storage R&D

No change during this month.

1.5.7 Integration Prototype Detector Modules

We continued readiness preparation for IPND production.

1.5.8 Initial Production Module Specifications

1.5.9 Initial Factory Tooling Specifications

1.5.10 Management - R&D Phase

No change during this month.

WBS 1.6 Electronics

(L. Mualem)

1.6.1 APD Module

Ordering of APD Arrays from Hamamatsu continued. Hamamatsu had delayed answer as to when additional components (bias resistor chain and connectors) are mounted on the carrier board. Hamamatsu engineers finally decided that this should be done before mounting the APD arrays. They therefore needed a component list from us to determine what work is needed and to quote the production of the modules. This work was finally completed and we are now awaiting the final quote for production.

Quantum efficiency tests of the previous production APD arrays are now complete. Documentation of the results will be forthcoming.

Additional documentation of the water cooling system is also underway. It is hoped that this will be suitable for a more complete review.

Production of additional components for the APD modules started at IU. Quotes for components are coming in and they are so-far in line with what was expected.

Additional design effort on the air cooling of TECs continued and is nearing a completed design. This will allow evaluation of the possible future of this technique as quotes for production could be obtained. It appears that the TECC designed by IU will be able to drive the modified TEC stack that would be used for the air-cooled system. This would reduce the number of changes that might be needed if the baseline design is changed.

1.6.2 Front End Board

Completed FEB3 prototypes were received in January. This month the interface board that will be used to talk to the devices over USB was produced. Effort is expected to ramp up on this project next month.

1.6.3 Power Distribution

The boards for the Power Distribution Box are still being produced and assembled.

A layout of the proposed IPND layout for power and cooling water distribution was produced for comment by the installation group.

1.6.4 Management - R&D Phase

No change since the last report.

1.6.5 Vertical Slice Tests

No change since the last report.

WBS 1.7 Data Acquisition

(L. Mualem)

1.7.1 DAQ Software

Efforts in DAQ software have started again. A survey of existing requirements documents was completed and a plan for completion of the missing documents that would be required for a review of the DAQ software system was outlined. Effort to understand the existing code and work toward getting a functional system has started on two fronts. The event builder software has been resurrected and is under study to determine what components are missing and what the plan forward will be.

In addition, the DAQ test stand which was abandoned a year ago has been resurrected and is once again able to communicate with at prototype DCM. The prototype DCM has been resurrected as well, and is now able to start-up, load its software from the network and begin communicating. There is still a lack of error-free communication between the processor and FPGA areas of the DCM, but this is now under investigation again.

1.7.2 DAQ Hardware

Effort on the hardware devices has resumed as well. The finalization of the DCM designs for IPND is underway. The changes to the timing system have also started. The simplified system will require some board modifications before the rest of the prototype components can be produced. Procurement of components can proceed in parallel with these changes.

1.7.3 Detector Control

1.7.4 Detector Control System

1.7.5 Management - R&D Phase

No progress this month.

WBS 1.8 Detector Assembly

(P. Lukens)

- 1.8.1. Plane Assembly Adhesive
- 1.8.2. Structural Design Validation
- 1.8.3. Liquid Scintillator Filling and Handling
- 1.8.4. Near Detector Assembly

No change this month.

1.8.5. Integration Prototype Near Detector (IPND)

During February, planning continued for the resumption of IPND work in the next few months. The collection, documentation and validation of electrical power requirements for the IPND electronics and DAQ systems continued. Discussions with FESS occurred to better specify the needs of the detector enclosure, including a discussion about adding 2 additional IPND blocks to the current installation plan so that the IPND would nearly identical to a complete Near Detector.

1.8.6. Far Detector Assembly Engineering

Argonne engineers continued work on the vacuum lifting fixture in February. They worked on an investigation of alternative of vacuum cups that is easier and faster to align than those used to date. Reliable operation of the lifting fixture was demonstrated, and a safety review allowing operation over the entire ANL building 366 floor, while carrying an extrusion load, was successfully passed.

The fire protection system for the adhesive dispenser was received.

1.8.7. Far Detector Installation Procedures

Although this activity has been formally completed, some installation planning work continued under WBS 1.8.9 during February. Review of FESS drawings of the Ash River civil construction continued. Another round of comments was returned to the architects of the Far Detector building.

Based on results from the vacuum lifting fixture tests, updated estimates of timeand-motion studies for module handling were made, and found to be in line with the baseline estimates for the full assembly schedule.

1.8.8. Far Detector Prototypes

During February, the scintillator leak test in the CZero building elevator-shaft enclosure was monitored.

Work on the Full Scale Assembly Prototype (FSAP) consisted of preparation of the vacuum lifter and adhesive dispenser, described above under WBS 1.8.6.

1.8.9. Management

During February, the Level 2 and Level 3 detector assembly managers participated actively in most of the WBS 1.8 technical work described elsewhere in this section.

WBS 1.9 & 2.10 Project Management

(J. Cooper)

1.9 Project Management – R&D

This set of WBS items is complete.

2.10 Project Management – Final Design & Construction

2.10.2 FY08

One **NOvA Technical Board** meeting was held on February 17. The main part of the meeting was devoted to EVMS training of CAMs.

A **NOvA Project Management Group** meeting was held on February 17. The talks presented and minutes of the meeting are available in NOVA-doc-3523(v6).

Now that the project has re-started and the full EVMS reporting is in process, the next step is to do the full reporting cycle more quickly. The Project Office has established a schedule for all the reporting input for each month and in November began to push each Level 2 Manager, each CAM, and Project Controls to execute the cycle within the allotted month. In the established schedule, these monthly reports should appear on the 20th working day of the following month. This month's report realizes that goal.

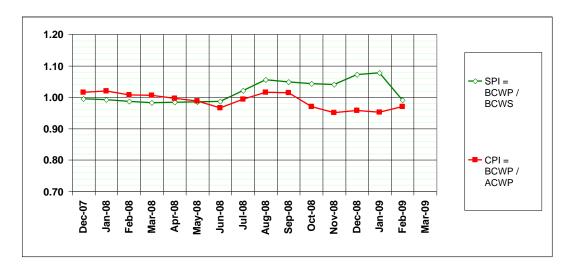

EVMS Summary

(S. Saxer, W. Freeman, H. Ferguson, E. McCluskey)

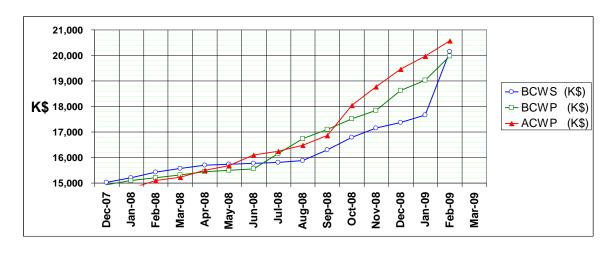

This monthly report focuses on the EVMS status relative to the baselined RLS as reviewed by DOE (Lehman) on April 30, 2008 and approved (CD-2) by Ray Orbach on September 15, 2008.

CPI and SPI curves.

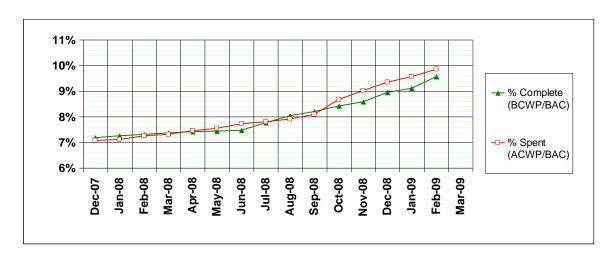

As discussed in the Overview section of this report, the Schedule Performance Index moved from 1.08 in January to 0.99 in February. This reflects the fact that in February real time crossed into the part of the NOvA schedule to which all tasks had been delayed to compensate for the FY08 Omnibus Bill action. Effectively, the project did manage to work ahead of schedule from July through January once funding was restored by the FY08 Supplementary Funding Bill and the FY09 Continuing Resolution, but that schedule advantage has disappeared as we crossed into the delayed tasks.

BCWS, BCWP, ACWP History.

Percent Complete Plots.

Baseline Change Control Log Actions

The NOvA Project Management Group serves as the highest level change control board. During February, two NOvA changes were approved by the NOvA Project Manager.

In addition, CR# 57 was approved by the Associate Director for Research and by the Federal Project Director since the project had crossed the cumulative change dollar threshold for the Associate Director and was quite close to the cumulative change dollar threshold for the Federal Project Director. We elected to keep the two approvals together for easy in tracking a new cumulative sum once CR#57 was approved.

Variance Summary for NOvA Control Accounts at WBS Level 2

The NOvA Control Accounts have been rolled up to WBS Level 2 in this report to match the Level 2 Contract Performance Report 1 on the previous page. The table below summarizes the status.

The FRA EVMS required reporting thresholds to DOE at WBS Level 2 are:

• Green: SV or CV < 5%

• Yellow: SV or CV in the range ≥ 5% but < 10% and the SV or CV is ≥125 K\$

• Red: SV or CV in the range $\ge 10\%$ and the SV or CV is ≥ 250 K\$

At the Control Account Level, the green/yellow/red bands have the same % thresholds, but the \$ thresholds are changed to 50 K\$ for the yellow and to 100 K\$ for the Red. Red requires a written variance analysis at the Control Account level.

In the overall project roll-up (see bottom line in the table), the project is within tolerance on the Cumulative SV and CV. The project started up early following the FY08 Supplementary Appropriation in July 2008, but in February 2009 crossed into the baseline schedule where tasks had been delayed following instructions from DOE. Our cumulative schedule variance SV moved from + 8% in January to -1% in February as many of the February tasks were not completed as scheduled. Our cumulative Cost variance CV improved from -5% in January to -3% in February.

The Construction roll-up (second line from the bottom) shows an overall project summary with the Cumulative SV and CV in the red and Current Month CV in the red. In both cases these are positive variances, but only on about \$ 2.2 M of Construction

effort to date. Most of the work has been on final designs in preparation for a CD-3b IPR, but in February a few CD-3a tasks were begun and now all the WBS Level 2 Construction tasks are active (half were still inactive in January). The Current Month SV is negative, reflecting tasks which should have been accomplished as we crossed into the tasks delayed to February 2009.

The R&D roll-up (third line from the bottom) shows an overall project summary with Cumulative SV in the green (-1%) and Cumulative CV in the yellow (-8%). For about \$ 17 M of BCWP on R&D to date, the R&D is costing more than planned due primarily to technical problems in the Detector Assembly WBS 1.8. The Current Month R&D SV is negative, reflecting tasks which should have been accomplished as we crossed into February 2009 delayed tasks.

In February, 35 of the 68 NOvA Control Accounts were active with scheduled work, performed work, or actual costs in the cumulative view. 11 of the active Control Accounts required a written variance analysis in January. These were written by the CAMs and approved by the Project Manager.

The largest (positive or negative) <u>cumulative</u> variances and their explanations as extracted from the February Variance Analysis Reports are as follows:

Largest few Cumulative SVs:

• 2.1.2 Far Detector Building SV = +960 K\$ on 96 K\$ of BCWS This SV increased from +623K\$ to +960K\$ between January and February.

Work was started in October 2008 using FY07 carryover funds as a Project Manager sanctioned strategy to advance this critical path item. Since this is a Level of Effort task, there is little BCWS or BCWP until the task starts in the baseline schedule in February. The tasks have now started, but even more work was accomplished due to the final push to get a biddable design ready for distribution.

• 1.0.3 NuMI Upgrades SV = +577 K\$ on 412 K\$ of BCWS This SV decreased from +577K\$ to +360K\$ between January and February.

Scheduled work in February was 239K\$, work performed was only 21K\$ because most of the work was done earlier than February. The work for 1.0.3 is ahead of schedule because funding and resources became available before the start dates in the project baseline. Beginning work early helps mitigate NOvA risk #95 (see Nova docdb 2841) which is the potential lack of Accelerator Division personnel.

• 1.8 Detector Assembly R&D SV = -145 K\$ on 1,271 K\$ of BCWS
This SV got worse from -145K\$ to -391K\$ between January and February.
The variance is largely due to the fact that technical issues with the Vacuum Lifting Fixture were finally solved in February after months of effort. Technical issues with the Adhesive Dispenser remain unresolved.

Largest few Cumulative CVs:

- 1.1 Site & Building R&D CV = +577 K\$ on 2,275 K\$ of BCWP

 This CV changed from +577K\$ to +345K\$ between January and February.

 This work is nearly complete as the final drawings are almost ready for the bid process.
- 1.0.3 NuMI Upgrades CV = +345 K\$ on 771 K\$ of BCWP
 This CV changed from +187K\$ to +345K\$ between January and February.
 The positive cost variance has been steadily growing and continues to look like a systematic over estimate of the manpower needed to complete the tasks. An ETC change is contemplated.
- 1.7 DAQ R&D CV = -580 K\$ on 218 K\$ of BCWP
 This CV changed from -564K\$ to -580K\$ between January and February.
 The DAQ hardware has required more debugging than anticipated.
 The initial version of the device was more complicated than originally anticipated. Some of this variance may be reclaimed in that there will be less development needed since the hardware has a more standard interface rather than a custom implementation.

The DAQ software variance is appears to be spread over all tasks, and is still under investigation for a complete accounting as a new team assesses the work left to be accomplished.

• 1.8 Detector Assembly R&D CV = -845 K\$ on 879 K\$ of BCWP
This CV changed from -831K\$ to -854K\$ between January and February.
The cumulative cost variance is largely due to the fact that several technical issues with the detector assembly remained unresolved as discussed above in the SV variance summary.

Milestone Analysis

Milestones completed this month: 0

Milestones which should be complete by now but are not yet completed: 12

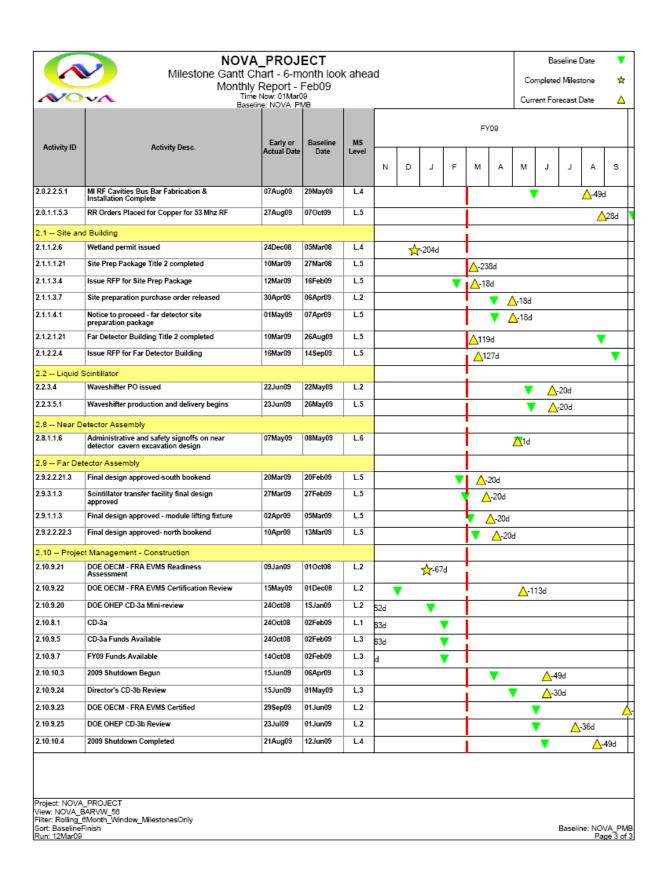

The list of missed milestones is shown below. Nine new milestones were missed in February, reflecting uncompleted tasks that the project had moved to February 2009 following the budget crisis caused by the FY08 Omnibus Bill. This list was discussed by the Project Manager with the Level 2 Managers and CAMs, and it looks as though about half of these missed milestones should be completed during the next month or so.

Here is the usual NOvA summary of milestones scheduled during the last few months with a six month look ahead to the future. The pace of scheduled milestones has increased, so the next few months present a challenge to increase the pace of completed effort throughout the project.
